AP-02: Motivations and Introduction

Software is Everywhere

Programming in the 21 century

- Software as complex as ever
- Command line interface not enough
- Data comes from multiple sources: structured (DB) and unstructured
- Single computer not enough
- Software development is a group activity
- Deployment on Web or mobile devices

Complexity Prompts for Innovation

- Object-Oriented Programming allows ever larger applications to be built
- But limited support for reuse
- OS + libraries not enough
- Reusable components are needed
- Multi-tier applications development increases the choices on how to build applications

Key Ingredients for Complex Software

- **Advanced features** extending programming languages
- **Component models** to ensure reusability
- **Frameworks** to support efficient development of (component based) applications
- **Execution environments** providing runtime support for ever dynamic software systems

The Software Architect

- A new role is needed: **Software Architect**
- to create, define or choose an **application framework**
- to create the component design according to a **component model**
- to structure a complex application into pieces
- to understand the interactions and dependencies among components
- to select the **execution environment / platform** based on cost/performance criteria
- to organize and supervise the development process

What are Frameworks?

- **Software Framework:** A collection of *common code* providing *generic functionality* that can be *selectively overridden or specialized* by user code providing *specific functionality*
- **Application Framework:** A software framework used to implement the *standard* structure of an application for a *specific* development environment

Framework Features

- Frameworks, like *software libraries*, provide *reusable abstractions* of code wrapped in a well-defined API
- But: **Inversion of control**
 - unlike in libraries, the overall program's flow of control is not dictated by the caller, but by the framework
- Helps solving recurring design problems
- Drives solution
 - Provides a default behavior
 - Dictates how to fill-in-the-blanks
- Non-modifiable framework code
 - Extensibility: usually by selective overriding

OO Software Framework

- Object-oriented programming frameworks consists of a **set of abstract classes**
- An application can be built simply inheriting from pre-existing classes in the framework
- Instantiation of a framework consists of composing and subclassing the existing classes

Examples of Frameworks

- General software frameworks
 - **.NET** – Windows platform. Provides language interoperability
 - **Android SDK** – Supports development of apps in Java (but does not use a JVM!)
 - **Spring** – Cross-platform, for Java applications
 - **Cocoa** – Apple's native OO API for macOS. Includes C standard library and the Objective-C runtime.
 - **Eclipse** – Cross-platform, easily extensible IDE with plugins

Examples of Frameworks

- Frameworks for Application with GUI
 - **MFC** - Microsoft Foundation Class Library. C++ object-oriented library for Windows.
 - **Gnome** – Written in C; mainly for Linux
 - **Qt** - Cross-platform; written in C++

Examples of Frameworks

- Web Application Frameworks [based on Model-View-Controller design pattern]
 - **ASP.NET** by Microsoft for web sites, web applications and web services
 - **GWT** - Google Web Toolkit (GWT)
 - **Rails** - Written in Ruby - Provides default structures for databases, web services and web pages.

Examples of Frameworks

- Concurrency
 - **Hadoop Map/Reduce** - software framework for applications which process big amounts of data in-parallel on large clusters (thousands of nodes) in a fault-tolerant manner.
 - **Map**: Takes input data and converts it into a set of tuples (key/value pairs).
 - **Reduce**: Takes the output from Map and combines the data tuples into a smaller set of tuples.

Framework Design

- Intellectual Challenging Task
- Requires a deep understanding of the problem domain
- Requires mastering of **software (design) patterns**, OO methods and **polymorphism** in particular

Design Patterns

- *General conceptual solutions to recurrent design problems*
- *More abstract than frameworks*
 - Frameworks can be embodied in code, but only *examples* of patterns can be embodied in code
 - Design patterns explain the intent, trade-offs, and consequences of a design
- *Smaller architectural elements than frameworks*
 - A typical framework contains several design patterns but the reverse is never true.
- *Less specialized than frameworks*
 - Frameworks always have a particular application domain
 - Design patterns can be used in nearly any kind of application

The 23 Design Patterns of the Gang of Four

Erich Gamma, Richard Helm, Ralph Johnson and John Vlissides

*Design Patterns: Elements of Reusable
Object-Oriented Software [1995]*

FM Factory Method	Creational				Structural			A Adapter
PT Prototype	S Singleton	Behavioural				CR Chain of Responsibility	CP Composite	D Decorator
AF Abstract Factory	TM Template Method	CD Command	MD Mediator	O Observer	IN Interpreter	PX Proxy	FA Façade	
BU Builder	SR Strategy	MM Memento	ST State	IT Iterator	V Visitor	FL Flyweight	BR Bridge	

Course objectives and Syllabus

Course Objectives

- Understand programming language technology:
 - Execution Models
 - Run-time
- Analyze programming metaphors:
 - Objects
 - Components
 - Patterns
- Learn advanced programming techniques
- Present state-of-the-art frameworks incorporating these techniques
- Practice with all these concepts through small projects

Run-time Systems

- Virtual Execution Environment
 - Memory Management
 - Thread Management
 - Exception Handling
 - Security
 - Debugging Support
 - AOT and JIT Compilation
 - Dynamic Link/Load
 - Reflection
 - Verification
- A concrete example: the JVM

Component Models and Frameworks

- Component-oriented Programming
- JavaBeans and NetBeans
- Spring and Spring Beans
- COM
- CLR and .NET
- OSGi and Eclipse
- Hadoop Map/Reduce

Advanced Programming Techniques

- Generic Programming
 - Java Generics
 - C++ templates
 - C# Generics
 - Scala generics
- Lambda Calculus and Functional Programming
 - Haskell basics
 - Type classes and Monads
 - Metaprogramming
- Functional Programming in Java 8
 - Lambdas
 - Stream API
- Scripting languages and Python

Selected Advanced Concepts in Programming Language

- Overloading and Type Classes in Haskell
- Closures vs Delegates in CLI
- Algebraic data types and Active patterns in F#
- Associative arrays in scripting languages
- Ownership and borrowing in Rust
- Extensions in Swift

IEEE Spectrum Ranking 2018-2017

Language Rank	Types	Spectrum Ranking	Spectrum Ranking
1. Python		100.0	100.0
2. C++		99.7	99.7
3. Java		97.5	99.4
4. C		96.7	97.4
5. C#		89.4	88.8
6. PHP		84.9	88.8
7. R		82.9	86.2
8. JavaScript		82.6	82.3
9. Go		76.4	77.2
10. Assembly		74.1	76.5
11. Matlab		72.8	74.4
12. Scala		72.1	73.9
13. Ruby		71.4	73.4
14. HTML		71.2	70.4
15. Arduino		69.0	70.0

IEEE Spectrum Ranking 2017-2016

Language Rank	Types	Spectrum Ranking	Spectrum Ranking
1. Python	  	100.0	100.0
2. C	  	99.7	98.2
3. Java	  	99.4	98.1
4. C++	  	97.4	96.0
5. R		88.8	88.2
6. C#	  	88.8	86.8
7. JavaScript	 	86.2	83.3
8. PHP		82.3	82.6
9. Go	 	77.2	75.2
10. Swift	 	76.5	72.1
11. Arduino		74.4	71.0
12. Ruby	 	73.9	70.8
13. Assembly		73.4	69.5
14. Matlab		70.4	69.5
15. Scala	 	70.0	67.9
